One of The Most Advanced Machines

by Donald K Aniston

One of the most highly technical, digital camcorders on the market today is the Sony Handycam DCR - SR85.

The Sony Handycam DCR - SR85 is completely dependent on its internal hard drive to hold all of its memory. That is why this small camcorder has sixty gigs of memory to store a bundle of information. This memory is more than what some modern computers have to offer. It also puts the consumer right in the middle of the action by having a zoom option that can magnify images up to twenty five times. This allows for those tight close-ups that are so hard to capture with many other digital camcorders.

Another great feature of the DCR-sr85 is that it uses hybrid recording technology.

The Sony Handycam DCR - SR85 is one of the most advanced machines on the market today for recording memories and special events. Anyone can use this device with its great zoom, unlimited memory capacity and a feature that allows for the technical buttons to be turned off during operation. The price is ideal for all the great accessories a person will receive. Sony has proven once more why they are a leader in the electronics field and why they evolve into new dimensions everyday.

Since this is a camcorder that does not use any external items to save memories, such as a Mini DV tape or a DVD, it has to offer people a huge amount of space to store items. Another great option that this camcorder offers is the zoom that can magnify images up to twenty five times.

This particular Sony product offers even the novice the chance to own and operate a very high tech piece of equipment at a fair price. Most pieces of equipment that are this technologically advanced come with a high price tag and a ton of directions. The DCR-sr85 does come with precise directions, but the price is reasonable and anyone can operate it with ease if they take the extra time.

Since it focuses specifically on its internal memory for storage, a person needs a way to share and record their special moments besides being dependent on the memory of the digital camcorder. Hybrid technology offers consumers the option to transfer data to a memory stick without the use of a computer. This is one of the new features that will be included in all digital camcorders in the near future.
