Running Slow Computer And Slow Computer Problems

Does your computer run like a slug these days? Do applications take forever to load? Do start ups and shut downs last forever? Does your PC freeze and even crash?

If you are experiencing any of these problems, you are probably trying to figure out why slow computer problems happen, and more importantly, how to fix them. I will discuss both in this article.

The reason why slow computer problems happen is the computer's registry. This is a database that regulates all the applications on your computer. Your PC would not run without the registry. As a result, new files and entries are added to the registry all the time, and eventually, this database is going to get too packed with "stuff." This ends up affecting other applications, and when this happens, your computer is going to start running like a slug.

Now that we know why [slow computer problems come about](#), let's now look at how to fix them. You can try to fix your registry on your own, but this is almost always a bad idea, because the registry is so tricky. Even those who know a lot about computers will often shy away from fixing the registry themselves.

Instead, you should fix your slow PC with a registry cleaner. It will first perform a free scan to find problems, and the bad files will then be listed for you, letting you decide if you want them off your PC. You will have to registry to do this, which will cost about 30 dollars, but that is MUCH less than you would pay at a computer repair shop. And, the registry repair program will keep future errors from returning.

Is your PC [running slow? Computer issues](#) are really one of the most annoying things to deal with. It is so frustrating when your PC takes forever to bring up applications and web pages, start ups and shut downs seem to take an eternity, you get the dreaded blue screen of death, and your PC freezes up and even crashes. Fortunately there is a remedy for a running slow computer that is inexpensive. I will discuss that in a bit, but first, I want to talk about what causes your PC to bog down in the first place.

All computers that use Microsoft Windows have a database that is called the registry. This serves as the central command center for your PC. It regulates all applications. Whenever you make a command, the registry is accessed. As part of this process, new files are added on an ongoing basis. But because so many new files are added, the registry eventually will get too big, and this ends up affecting all of the other applications on your computer.

But if your PC is running slow, computer problems can be easily fixed with a registry cleaner. It will start by performing a free scan to find all of the corrupt files and invalid entries in the registry. Then, you are given the option of deleting those files. And, the registry repair program will work to keep future errors away.

You should not try to fix registry errors on your own, because it is very easy to make a mistake that could destroy your PC. For only about 30 dollars, you can get thorough registry repair that will keep your mind at ease.
